

Team,

To provide efficiency for our account management, the following task is selected: account creation, deletion, and disablement for specified accounts.

The Powershell script is provided as such:

To create a new user account for Lily:

```
$Password = Read-Host -AsSecureString
$params = @{
    Name      = 'Lily'
    Password  = $Password
    FullName  = 'Lily Niebuhr'
    Description = 'Description of this account.'
}
New-LocalUser @params
```

To disable Lily's account:

```
Disable-ADAccount -Identity Lily
```

To delete Lily's account:

```
Remove-LocalUser -Name "Lily"
```

I admit I had to research how to write the script because I did not have the knowledge prior. This task should help create, disable, and delete a user account by any name by replacing "Lily" with another user's name and other details with the specific user's information.

I hope this helps,

Uyen Nguyen
